IBC Project: AOMIC Working Memory

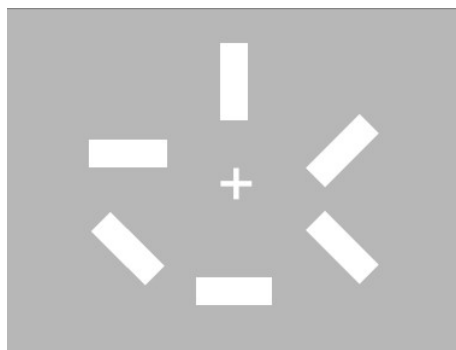

In this experiment, we will be testing your memory.

Following is an example of what a run might look like:

1. Each trial will begin with a green cross as shown:

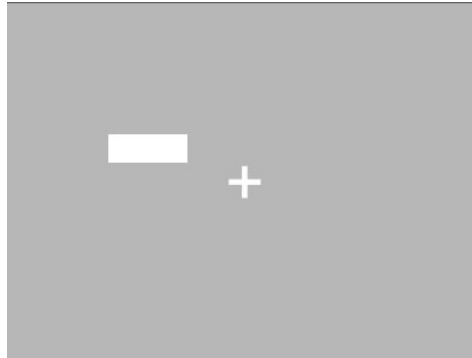

2. Then, six rectangles, each in different orientations will appear for 1 second. Try to remember their orientations.

3. Then, a blank screen with a cross will appear and stay for about 2 seconds.

4. After this, one of the six previously shown rectangles would appear again. This rectangle might or might not have the same orientation as the one in the same position of the six shown previously. For example:

5. Your task is to say whether or not this rectangle has the same orientation. In this example, it does indeed have the same orientation as before.
6. When this rectangle disappears, press the button under your **index finger** if it does have the **same orientation** and the button under your **middle finger** if it does **not**.

This task will be done twice and each run is about 6 minutes long.
