IBC Project: AOMIC Face Perception

In this experiment, you will be shown a series of videos of several facial expressions by several different people. Your task would be to try and remember both the faces and expressions in the videos. After each run, we will ask whether or not you saw a video in the run before.

Following is an example of what a run might look like:

1. Several videos with different facial expressions by different people will be shown one after another for 6 minutes, with the MRI scanner running. You do not have to respond during this run. But please try to remember both faces and their expressions as shown.

2. After the acquisition, again, a few similar videos will be shown for about 2 minutes, without the MRI scanner running. If **you have seen** the same person doing the same expression in the run before, press the button under the **index finger** and **otherwise**, press the button under your **middle finger**.
3. These two runs, that is, the 6 min run followed by the 2 min run, will be done twice.
